

>> **Name: Ammonium chromate(VI) ((NH₄)₂CrO₄)**

Synonym(s): Diammonium chromate

CAS Registry Number: 7788-98-9

(NH₄)₂CrO₄

Molecular Formula: CrH₈N₂O₄

Molecular Weight: 152.07

Accurate Mass: 151.988917

Percentage Composition: Cr 34.19%; H 5.30%; N 18.42%; O 42.08%

Use/Importance: Used in flexible printing, photosensitisation, as wood preservative, as analytical reagent

Physical Description: Monoclinic, golden yellow needles. Partially reverts to the dichromate on standing

Solubility: Mod. sol. H₂O; spar. sol. NH₃, Me₂CO

Other Data: Weakly paramagnetic. Dec. above 100°. See also Ammonium dichromate(VI) ((NH₄)₂Cr₂O₇) [HWZ15-X](#). ΔH_f° (per (NH₄)₂CrO₄) -1166 kJ mol⁻¹

Aldrich: 21603-8

Fluka: 9707
