

>>Entry Name: Sodium chromate(VI) (Na₂CrO₄)

Synonym(s): Disodium chromate. Chromitope sodium. Rachromate

CAS Registry Number: 7775-11-3

Related CAS Registry Numbers(s): 10039-53-9

Na₂CrO₄

Molecular Formula: CrNa₂O₄

Molecular Weight: 161.973

Accurate Mass: 161.899703

Percentage Composition: Cr 32.10%; Na 28.39%; O 39.51%

Source/Synthesis: Manuf. from Na₂Cr₂O₇ and NaOH

Use/Importance: Commercially available. Used as oxidant, corrosion inhibitor, in wood preservation. ⁵¹Cr labelled compd. used as radioactive agent (*Sodium chromate Cr 51*, USAN)

Physical Description: Yellow cryst.

Melting Point: Mp 780°. Mp 792°

Solubility: Sol. H₂O; fairly insol. MeOH, EtOH

Other Data: Isomorphous with Na₂SO₄. Weakly paramagnetic. Transition temp. 413°. ΔH_f° (per Na₂CrO₄) -1341 kJ mol⁻¹

Hazard & Toxicity: Cr^{VI} compounds are human carcinogens (IARC Group 1) MEL: long-term 0.05 mg m⁻³ (as Cr). Occup. exposure associated with 'chrome ulcer' (skin ulcerations). Mutagenic props.

Aldrich: 30783-1

Fluka: 71400

>>Derivative: Tetrahydrate

CAS Registry Number: 10034-82-9

Molecular Formula: CrH₈Na₂O₈

Molecular Weight: 234.034

Accurate Mass: 233.941963

Percentage Composition: Cr 22.22%; H 3.45%; Na 19.65%; O 54.69%

Source/Synthesis: Formed when temp. is kept above 26°

Physical Description: Stable yellow monoclinic needles

Melting Point: Mp 62.8°

Other Data: Loses H₂O at 63°. Stable in contact with its soln. only >26° and below 62.8°

Aldrich: 21662-3

>>Derivative: Hexahydrate

Molecular Formula: CrH₁₂Na₂O₁₀

Molecular Weight: 270.064

Accurate Mass: 269.963093

Percentage Composition: Cr 19.25%; H 4.48%; Na 17.03%; O 59.24%

Physical Description: Yellow triclinic cryst.

Other Data: Loses H₂O at 25.9° to form tetrahydrate

>>Derivative: Decahydrate

CAS Registry Number: 13517-17-4

Molecular Formula: CrH₂₀Na₂O₁₄

Molecular Weight: 342.125

Accurate Mass: 342.005353

Percentage Composition: Cr 15.20%; H 5.89%; Na 13.44%; O 65.47%

Physical Description: Deliquescent yellow monoclinic cryst. (H₂O)

Other Data: Loses H₂O at 19.5° to form hexahydrate and at 20° to form tetrahydrate
